

P6_T3_AI

Sentence heatmap · Likely human, 28% signal

DEMO ANALYSIS — not a real prediction

How to read the marks

- Low signal: left plain — nothing notable was measured in the sentence.
- Medium signal: grey tint, single underline — some characteristics were found, but fewer or weaker.
- High signal: red tint, double underline — several characteristics associated with AI-generated examples.

These marks are signals, not proof. They do not show who wrote the text, and every pattern measured also appears in human writing.

The document

From this day forward, every piece I publish will carry a simple declaration at the very top: *“100% Human Written.”

If you are wondering why, the answer is simple. I am fully aware that the vast majority of what we read online today is heavily AI-assisted, if not entirely generated by algorithms. In many contexts, I honestly do not mind. If I am looking up the instructions to operate my new toaster, I don’t need the emotional reassurance that a human being crafted the manual—I just need it to be accurate.

But when we cross the line into art and journalism, the origin matters immensely. When it comes to poetry, prose, and storytelling, the entire point is the deliberate, masterful arrangement of words. It is about crafting sentences and paragraphs designed to stir something real inside the reader.

Because of this, I believe we are due for a serious reckoning of accountability. I never thought I would live to see the day where I had to question whether a profound thought was born from a human soul or a server farm. The time has come for those of us who genuinely write to draw a line in the sand and push back against this tidal wave of imposter authorship.

I know the counterargument: *“What happens when AI catches up and learns to replicate human nuance and subtlety perfectly?”*

First of all, it won't. Humans possess a unique, intrinsic creative wiring that simply cannot be synthesized or mimicked by code. But secondly, no matter how sophisticated these text generators become, we will always desperately need human writers. We need voices that are free to grapple with the actual human condition, expressing the raw, uncensored concerns of a beating heart.

AI is inherently restricted, censored, and safe. It acts as a great equalizer, but in the most depressing way possible. It takes abysmal writing and elevates it into bland, mediocre mush. Worse, it takes brilliant, high-quality writing and drags it down to that same sterile baseline, stripping away all the color and leaving behind a uniform, corporate gray. A lot of writers today will take a draft, dump it into a prompt box, and say, “Clean this up.” That is a fatal mistake. The end result is almost always a neatly formatted, dainty pile of horse manure.

Now, in the spirit of 100% transparency: Do I use ChatGPT?

Absolutely. I use it constantly. I use it for research, generating shopping lists, drafting the occasional mundane email, throwing together Facebook Marketplace listings, and doing heavy lifting for my day job. It is an incredible tool that saves me hours of time.

Let the machines handle the shopping lists and the toaster manuals. But the art stays ours.
